

1 This or That

1.1 Such or so

Imagine that we want to show the title of the chapter in the footer and the pageumber in the header. At the first page of a chapter, this would mean that the title is shown twice, which does not look that good. When we also want the pagenumber not to show up on top of every page we have to set up the header and footer in such a way that the first page of a chapter is treated differently.

This sample shows an application of logical running heads. We set up the header and footer texts to show the pagenumber and chapter title. One can use the name of a sectioning command as keyword.

2 Here or there

2.1 Yes or no

We can temporary change the status of the header and footer of a page where a sectioning command occurs. Here we only need to set the chapter related values.

We simply switch of the header. When we had said `high`, the title would have been moved up. The footer is assigned a logical name of the alternative footer text. This alternative is defined by `\definetext`, where the second argument specifies the location.

This is typically a feature that can go unnoticed for a long time, unless desperately needed.
